EFFICACY AND SAFETY OF THE PROSTATE ADJUSTABLE CONTINENCE THERAPY PROACT\textsuperscript{TM} FOR THE TREATMENT OF POST PROSTATECTOMY INCONTINENCE IN A LONG TERM FOLLOW-UP

Hypothesis / aims of study
Many devices have been proposed for the treatment of post radical prostatectomy urinary incontinence (PRPUI). Some of them have showed good results in a short term follow up and disappointing results in a longer follow up. We investigated if the results obtained with ProACT\textsuperscript{TM} are durable in patients with PRPUI in a follow-up longer than five years.

Study design, materials and methods
We evaluated in a prospective study 23 patients suffering from PRPUI and treated by ProACT\textsuperscript{TM} and followed by a period longer than three years. Preoperative and postoperative evaluation included pads count, Incontinence Quality of Life Evaluation (IQoL) and evaluation of the impact of incontinence (IIQ). Preoperative and postoperative data were compared to determine if the variations were statistically significant.

Results
The follow up ranged from 60 to 83 months (m = 65 months). There was a significant reduction in pads count from a mean of 5.3 ± 2.1 to 1.4 ± 1.1 diapers/day (p < 0.001). There was also an important reduction on the impact of incontinence dropping from 34.42 to 19.53 (p < 0.05) and also an improvement in IQoL from 61.8 to 71.7. Overall from the 23 patients 15 (65.21%) are dry or wearing one pad a day in the last follow up. Revisions were necessary in four patients (17%) due to balloons leakage or migration. No major complications were observed.

Interpretation of results
ProACT\textsuperscript{TM} is a safe effective and long lasting procedure for the treatment of PRPUI. The procedure is associated to acceptable levels of complications and revisions.

Concluding message
In a long term follow up ProACT\textsuperscript{TM} continues to be a good alternative for the treatment of patients suffering from PRPUI.
